I have tried TRIANGULATE and TRIGRID. The plane interpolation seems to work ok if I only use the value (Z) at the center of each polygons and if polygons are far from the poles. I have also tried the spherical triangle gridding. It took around one hour of processing with the final error message :

```
% TRIGRID: Points are co-linear, no solution.
```

I have tried to process the same FVALUE as the plane case, i.e. evaluate at the center of each polygon. The total number of points to be triangulate is around 50,000 for a full Earth coverage. I guess it's too much for trigrd.
