
Subject: CG resizable window won't resize during read

I have an odd probably insurmountable problem with CG resizable windows. If I have lots of similar plots looping through different objects, I like to do something like this on the command line:

```
for i=0l,nobj-1 do begin
  cgplot, blahblahblahblah, /window
  cgplot, blahlblahblah, /overplot, /addcmd
  ...etc...
```

```
  str=" & read, str ; pause for me to look at it and hit enter when I'm done
end
```

The problem is that, while I'm looking at one of these plots, while it's waiting at the read line, I want to resize it. And I can resize the window itself, but the plot doesn't resize. And it doesn't resize after I hit enter - just puts up the new plot. But once I finally get out of the loop, it will finally remember what it's supposed to do and resize the final plot.

7.0.4 Mac Leopard

Any suggestions?

-Jeremy.
