
Subject: How to specify which exact version of a subroutine to use....

Hi there,

I frequently encounter the problem where I am running a program that utilizes a number of IDL libraries (ie, coyote, solarsoft - etc.) . The problem that crops up constantly is with the program addressing the wrong version of a given subroutine. ie, right now I am trying to use a certain coyote routine and my code is crashing because it is picking up an older version of the routine that is attached to the solarsoft library - rather than the new version that is located locally on my own machine.

Can I specify the exact version of the routine that I want the code to use - by providing the full path or something ?

Cheers

George.
