Hello,

is there a way to undefine variables?

for some reasons it would be nice (eg. undefineing keywords..)

just look at this:

pro example

a=10|

```
if datatype(a) eq 'LON' then print,'yes, its long'
```

UNDEFINE,a

```
if datatype(a) eq 'UND' then print,'Thats what I want!'
```

end

what to take for UNDEFINE?

- delvar is only working in main-level... so it is not usefull for me...

any help wanted...

Panther

PS: Congratulations...to the domain: dfanning.com !!!!

i am thinking about panther@jungle.com or

panther@jungle.org,

but its occupied.....what a pity!
