Subject: legend of polygon

Hi,

although the Coyote library provides excellent solutions I am playing around with the new graphics. The problem I have is the LEGEND():

- points on the plots are shown in the legend with three points instead of one; using `SAMPLE_WIDTH=0`, you overlay all three over each other so you see only one symbol - anybody has a better solution?

- polygons plotted by `POLYGON()` function are not shown in the legend - any reason why?

Cheers, Klemen
