Hi David,

Thanks for the code!

Just got bit by a w=-1 on line 146/147 of akde.pro. I don't understand the details of how your code works so I just added an check:

```
w = where(z lt 5,nw)
IF nw GT 0 THEN res[j] = 0.75 * total((1.....
```

I guess this check should go with each where())... I, for one, am not very good about this.

Ciao,  
Gianguido
