
Subject: looking for IDL streamlines help

I'm having trouble figuring out how to do streamlines in IDL. What I'm looking for is something analogous to the STRMLN routine in NCAR graphics. It seems that the IDL routines PLOT_FIELD or VEL would be applicable, but I guess I'm not getting the keywords set correctly.

Any help would be greatly appreciated.

Scott Nolf

p.s. - the data I'd like to streamline is global u and v wind components at a particular pressure level (ECMWF data).
