I have been experimenting with various ways of getting Wave plots into reports written using Word 6. One option would appear to be to use CGM files. Wave claims to produce such things and both Word and CorelDraw claim to be able to read them. Unfortunately, all attempts result in the reading program complaining that the file is not a valid CGM file.

Am I doing something silly, or have Visual Numerics managed to produce CGM files which are incompatible with the most common Windoze applications?

All tips and suggestions gratefully accepted.
