Hi Brian,

I think what Andrew meant is that it is a fundamental limitation of Quicktime that it can't play movies with less than 5 fps. I don't think there is anything we can do. But perhaps you could use Paulo's suggestion of writing out each frame multiple times.

Regarding the WRITE_GIF problem, can you provide a simple reproduce case? I'm trying to reproduce it here, but I can't seem to get it to fail.

Thanks.
