I have a simple code that includes the following line:

```
COLORBAR, Position=[0.85, 0.50, 0.87, 0.95], $
      Range=[0.0, cmax], NColors=nLevels, /Vertical, $
      Format = '(f3.1)', CharSize = char_size, /Right,
Title=variable
```

When I run the code in the development environment I get the following error:

```
% Compiled module: COLORBAR.
% Attempt to call undefined procedure/function: 'COLORBAR'.
% Execution halted at: GLSEA2_TEST      443 /glsea2_test.pro
%                               $MAIN$
```

```
IDL> print, file_which('colorbar.pro')
/Applications/itt/idl/idl81/lib/graphics/colorbar.pro
```

I've tried fiddling with the path using the preferences menu.
Currently it is set to the default.

I'm not sure what is happening. Can someone point me in the right direction please? Thanks.
