IDL 8.1 itself seems OK in the very limited testing I have done using some of my own routines, but lmgrd has been problematic. It keeps crashing out when run from launchd, and complains about code-signing errors. When run from a terminal it's OK, though if one uses the '-z' option (as used in the launched plist) it dies immediately with an 'illegal instruction' error. However starting lmgrd from a regular terminal is OK until I reboot - I can close the terminal and lmgrd keeps running.

I contacted ITT about this, they don't (apparently) have any Lion systems to test or build with as yet.

Robert
