Hello! I'm a beginner user of IDL,
I have a little problem that I can't solve, can you help me?:

From a 3D array, I want to look on the 3rd dimension (z) of each
coordinate (x,y) of the array and count
the number of time that I can found a specific number:

for example:
 arr=[[[0,1],[2,1]],[[2,2],[1,1]],[[0,1],[0,0]],[[1,1],[1,1]]]   -
>   number 1 appear 3 times on arr(x0,y1)

How can I do this?
Thanks
