Subject: TITLE property using object graphics Posted by Mike Potter on Sun, 14 Aug 2011 19:24:04 GMT

I'm guessing I'm missing something simpe. Being an old-school IDL programmer I've decided to explore a bit of the object graphics functions. I immediately ran into a problem just cutting and pasting from the help file examples. Here's an example:

theory = SIN(2.0*FINDGEN(200)*!PI/25.0)*EXP(-0.02*FINDGEN(200))

p1 = plot(theory, title="Test")

When doing so I get an error message: "PLOT: Graphics window does not exist".

If I just do the plot with no title it works fine. If I then try:

p1.TITLE = "Test"

I again get the same error message. If I "Print, P1" it gives me a list of the properties; TITLE = <NullObject>

So what's up?

Thanks! Mike Potter
