I am enhancing a set of postscript plots, replacing the default vector fonts, etc. Some of the features of the plot, such as `psym =3`, `psym =4`, and the box around the legend, retain the thin vector font style. I am aware of the `symcat` and `sym` packages, but they do not offer thicker 'x' symbols or thicker but not filled diamonds or squares. Is there an easy way to do this without, for example, defining `usersyms` or manually redrawing the legend box?
