Here's a command line kluge that does some of what you want:

```
pro getdefval,x
; Give a user 3 seconds to supply a value, otherwise use a default
t= 0
print,'Choose x,y, or z:',format='(A,$)'
while t lt 30 do begin
  wait,0.1
  t += 1
  x = get_kbrd(0)
  if byte(x) ne 0b then break
endwhile
print,''
if byte(x) NE 0b then print,'Using user supplied value of ',x else begin
  x = 'z'
print,'Using default value of z'
endelse

return
end
```
