Here is a little program that will do what you want, Bobby. But if you really want to learn IDL in a short period of time, beg, borrow, or steal the Learning IDL training manual. It is chock full of good examples and tutorials and makes learning IDL much, much easier. If you have to buy it, it costs \$50 from RSI. Tell your employeeer I personally guarantee it will make you 500% more productive while you are there at Goddard!

PRO ASK

 ; Ask for a 1 or a 2.

prompt = 'Enter a "1" or a "2": '

answer = 0

READ, answer, PROMPT=prompt

 ; Do something with the value.

IF answer EQ 1 THEN PRINT, 'I got a one!' ELSE \$

 IF answer EQ 2 THEN PRINT, 'I got a two!'

END

You might also put the answer into a CASE statement rather than a series of IF statements. Something like this:

CASE answer OF

 1: PRINT, 'I got a one!'

 2: PRINT, 'I got a two!'

 ELSE: PRINT, 'I do not know what I got!'

ENDCASE

Let us know how it goes.

David
