Am I the only one who thinks that whenever the bug source is not in
a .pro file, it seems to go ignored by ITTVIS, with the bonus of new
and complementary related bugs at every new IDL or OS release?

I mentioned some at

 http://groups.google.com/group/comp.lang.idl-pvwave/browse_t
hread/thread/3828b3d0408162e4

and links in it, with no answer yet. The multiple bugs on object
graphics rendering seem to only multiply. For the bug with the license
manager I mentioned above (for a new OS, Fedora 15) I had to find a
solution myself (change back the names of the ethernet devices).
