Subject: idl system variable for overflow/underflow errors
Posted by simona bellavista on Wed, 07 Sep 2011 15:06:09 GMT

Hi all,

I am trying to debug a program that give overflow errors and I get a
printout that says "Program caused arithmetic error: Floating
overflow". I would like to know if there is a system variable that
registers that an overflow has happened, something like !overflow = 1
if an overflow has occurred, otherwise zero.

Thanks a lot
