Hi

I found yesterday a bug in one of my programs. Also I figured that idl
behaves different in handling my failure on 64 bit windows.

Can one verify a recent idl version windows 64 bit if this program fsck
off the idl eclipse environment.

If that happens you need to remove it from the task manager. Otherwise
you can't restart idl

```
pro bug1
   problem = {comment: 'test'}
   file = 'testfile.nc'
   file_id = NCDF_CREATE(file)
   NCDF_CONTROL,file_id,verbose=0
   NCDF_ATTPUT,file_id,global=1,'comment', problem
   NCDF_CONTROL,file_id, /ENDEF
   NCDF_CLOSE,file_id
end
```

other platforms 32 bit windows or 64bit linux just don't write that
attribute.

Well it is my bug doing nonsense, but such a crash or different doing
isn't also wanted.

cheers
Reimar
