Hi,

That should work, but you have to be sure, that the value you are looking for is 'alt' and not ' alt' or ' alt '.

Another thing,

" where(stregex(column_header, '^alt\$',/boolean)) " can give '-1' if 'alt' is not found in column_header !!!

From IDL8.0, ittviz has introduced the negative array indexing, so you have to be really careful with the where() function.
(I don't know how GDL will work.)

It will be better to to :

```
test = where(stregex(column_header, '^alt$',/boolean), count)
if count ne 0 then alt = column_header[test] else message, 'No alt
Found'
```

Cheers,

Vincent
