Folks,

Is resizing in general just broken in Function Graphics
windows? I can basically take any program I've written
in the past couple of days and start resizing the window
to get all kinds of strange and wonderful things to happen.

In particular, with the program I am playing with right now,
even though the color bar has been positioned with the
POSITION keyword, it can appear nearly any place in the
window. Sometimes its length fills up the entire window,
sometimes it is WAY smaller than I intend, etc. No rhyme
or reason to it that I can see. :-(

Cheers,

David
