Subject: help, IDL eats my variables

Question - I would like to run several instances of a function and save the output to several independent variables, in one IDL session. It seems, periodically, IDL 'eats' my saved variables and I have to start over! (sigh) This seems to correlate with running something that throws an error; IDL appears to 'retail' and wipe everything out - is this correct? Is there any way to avoid this behavior? (besides, well, not having a function throw an error...)

thanks!
