I put your data into a text file, and, adapting from the example in the help, did

```
a=(read_ascii('testkml.txt')).(0)
p=plot([0,0],/
  no data,xrange=[-180,180],yrange=[-90,90],map_projection='equi rectangular')
poly=polyline(a[0:1,*], /data, color='red', name='testkml.txt',
  thick=2.)
p.save,'test.kml'
```

And got a file that seems to work in Google Earth. But I do not know how to do it with variable colors (do not even know if Google Earth supports it in a line).
