That sorta depends on what you mean by "access"..... If you just want to log-in and use the basic linux commands, then you just need to get a secure-shell (which I think is probably free). If you want to pass x-graphics (such as xclock), then you need an x-server of some sort on your windows machine. I have found that hummingbird exceed works great, but is costly. If you want to "screen share", and project your ubuntu screen on your windows machine, then you need to set up a VNC server. I can't help you with this, since I primarily use Mac OSX (laptop, home computer, and workstation), and modern OSX has a screenshare app pre-installed.

But this should get you moving the right direction.
