I tried like this, which works:

IDL> b=list(a[0],a[1],a[2],/extract)
IDL> print,b
       1
       2
       3
       2
       3
       4
       5

..but in real life, 'a' contains hundreds of short arrays, so that line's impractical. The following, which I could easily make - and would expect to be equivalent - doesn't work:

IDL> b=list(a[[0,1,2]],/extract)
IDL> print,b
       1   2   3
       2
       3   4   5

Am I missing something obvious?

cheers,
Greg
