Hi,

I have an IDL-related question which may actually be a Apple software issue...

I have may postscript plots made with multiplot.pro routine. I never had any problem to view these .ps files with standard ps viewers with Linux (kghostview, okular...). But I am now a Mac user and it turns out that Mac ps viewers (Preview, Skim, MacGhostview) fail to open correctly these files, whereas they are ok for any "non multiplot" postscript files.

Note that eps figures generated with multiplot.pro are correctly opened by Preview or MacGhostView, so the problem is really with ps files only.

If anyone has an idea to solve the issue i would be quite grateful because I have been using multiplot.pro to create ps figures almost everyday...

Thanks!
