How about something like:
lo=rebin(b[*,0], [nl,nt])
hi=rebin(b[*,1], [nl,nt])

logic=(d ge lo) AND (d lt hi)
newd=d*logic

Not sure I get what your 't' array is for, but:

p=total(newd,1)/total(logic,1) ;should do it

I may very well have switched dimensions 7 times in the above code. columns-rows rows-columns... yikes

G
