Hi Craig, yup, that is a big problem, which I had to correct a while back. I create a FITS structure of a fixed size at the beginning and fill it within the FOR loop and trim it at the end.

I only concatenate arrays so as to put them into fields in the FITS table (for e.g., `x = [[x1],[x2],[x3]]` and `struct.field = x`).

One more thing that I don't do: I don't even use the `where()` function in my matching as `where()` searches through the entire array EVERY single time. If you are matching large arrays, `where()` ends up being the biggest bottleneck.
