Subject: How to make an input parameters file??

Posted by DooZer on Sat, 28 Apr 2012 07:52:46 GMT

Hi!

I'm writing a program for reading and processing LIDAR data output.
The program is divided in some subroutine and each sub use some of the
parameter i use to specify in the main routine. My pourpose is to
remove all the paramenters from the main routine and store them in an
ancillary .txt file, in order for the users of the program to modify
only the txt file to run their own different experiment setup (the
program itselk makes only calculus and should not be modified). I have
thought to write another subroutine, called, for example,
'parameters.pro', where i'll store all the parameters and then i call
it at the beginning of the main routine, but the number of out
parameter in the calling sequence is big and the risk is to have a
messy code.
An suggestion???
Thank you!
