If you know these line groups in advance, and you just want to label the groups, you could use something like:

```
zz = [5,6,9,10,11]
```

```
n_groups=2
```

```
group=[0,0,1,1,1]
```

```
for i=0,n_groups-1 do begin
```

```
  q=where(group eq i)
```

```
  ...some operation on zz[q]...
```

```
endfor
```

If you don't know in advance, maybe you can create this group vector out of your amp array. If amp is a float representing amplitude, I can't see how you'd do that, but I'm just guessing what you have.

Greg
