While were at this droplist thing, I wonder if
someone out there know how to cascade droplists?

```
listitem1
listitem2 -->sublistitem1
           sublistitem2
listitem3
.
.
```

I've seen some code sample of cascaded lists using
widget_button and the /menu keyword. But then you need to generate a
widget_button definition command for each item in the list.
My program generates, among other things, string arrays which is
perfect for this type of construct:

```
str=generate_string()
list=widget_droplist(tlb, value=str, uvalue=str,
event_pro='selection_list')
```

Now, I've also seen cascaded lists using cw_pdmnu. But that method
looks to
messy for my liking.

Many thanks.
