Brian Handy is traveling and unable to post to this newsgroup,
but he points out to me that for his angstrom symbol he uses this:

```
ang = STRING(197B)
```

He claims it works on the display and in PostScript files.

I don't know. I think it should be disqualified as being *way*
too easy. Most of us programmer types would feel
uncomfortable with it.

Thanks, Brian!

David
