Fellow IDL folks:

The brain imaging group I am working with is interested in implementing some sort of 3D rendering to enhance the accuracy of localization of structures within the human brain in Magnetic Resonance images.

We are only in the very preliminary stages, wondering what the different options are with regards to the best techniques to use. We are hoping that someone has approached this problem already, and may have some pointers to existing software programs or routines (preferably in C).

Also, if you have any suggestions for using IDL's rendering tools, or some example code, I would be extremely grateful. I remember trying IDL's rendering about a year ago and not being terribly impressed with the results. Maybe I just didn't know what I was doing (which I hope is the case).

Thanks!

Dave
