That's a good thought, thanks!

I don't have a good understanding of what exactly the writeu is doing when it runs in the for-loop. The input file is in BIL format (interleave=1) and I would like the output file to be, as well. Is there a way to specify in writeu that it should be organized one way or another?

Brian suggested in his code using Interleave=2 (BIP), I guess you should have 1 (BSQ), which you actually do, so we are not getting anywhere... :)
