Hi,

we are using idl also on our HPC cluster.

All machines are running SuSE SLES11SP1 (x86_64).

One user wrote an request, that his idl session is crashing frequently.

So I tested it at his desk - it took 5min until the gui was useable (for a moment). Just starting idlde took 32GB memory. Every click takes endless.

Has anybody found a work around or settings making it usable ?

Not every user can work at the cli only ...

Thanks, Peer
