
Subject: Procedure won't compile, too many files open, Win NT V4.0

TIA for reading this,

I have an IDL procedure that opens about 18 files at once. Under Windows NT, IDL can't "find" and compile new procedures once these files are openend. If I close one file (any one file) IDL can now magically find and compile new procedures. I assume that I am running in to a FILES=20 sort of limit in NT (18 of my files along with a std-in and a std-out or two that IDL must use to communicate with the user). Is this an IDL constraint or a Win NT constraint? In either case what is the solution (please do not recommend opening fewer files)?

Thanks again,

--
