
Subject: changing colors on a Mac

I just got a Mac version of IDL and boy am I upset.

My wonderful XDISPLAY widget which is used for drawing ROIs and display images, which runs great on several unix flavors, seems to be quite buggy on the Mac version.

It appears that in order to change the colors used for display you not only have to change the LUT but then redisplay the image as well!?!?!?

Is this true? Will this remain with IDL5.0? Is there a work around?

Any advice would be greatly appreciated.

Phil
