HI Allard,

I was just wondering if you could maybe offer some tips on how to use the HANTS algorithm in ENVI IDL 4.7? I'm new to IDL and it all seems to be quite overwhelming. I'm attempting to use HANTS to denoise the NDVIs of 16-Day L3 Global 250 m datasets (short name MOD13Q1) but don't understand how to implement the *.pro files included in the HANTS zip file. Is this even suitable/possible?

I would be very grateful for any help you can offer,

David Lee
