The shortest answer if you are just starting out, don't worry about TEMPORARY(), just set the variable to 0.

LATLON = 0

It works 99.99999% as well. Who cares if it uses two bytes of storage?

The short answer is, download the file from Fanning's site and put it in your current directory. That works as long as you don't change to another directory.

The slightly longer answer is, download the file and put it with your IDL path. Learn about your IDL path.

The even longer answer is, download everything from Fanning's site and put it in your path!

Strangely, the longest answer is the shortest to write.

Craig
