---

Hi all,

I have an array (e.g. `fltarr[1133,751]`) with a range of different flag values, and i want to find the center of gravity of irregularly shaped regions of interest within this array that consist of units sharing the same value. Units which make up a roi will all be connected.

e.g. `i=where(array eq 1,ict)`

Find center of gravity of i.

I want the result to be a location that makes sense within the parent array.

Is anybody able to help?

Thanks,

Ian
