Since you use WHERE to identify the bad record, I'll assume it's something like this:

```
bad_ind = WHERE(data EQ bad)
```

One way to go about finding the good records is by using the COMPLEMENT keyword to WHERE:

```
bad_ind = WHERE(data EQ bad, COMPLEMENT=good_ind)
```

```
Then,  
data = data[good_ind]
```

Not necessarily the best way, but gets the job done.
