> I have two plot setups, and from what I can tell, the eps files should come out with plots exactly the same physical size, BUT of course they are not. Can anyone tell if I am missing something simple, or if there is a work around? I believe the first set of code produces plots about 1 square centimeter larger than the second code (for some reason that was not the case earlier this week, they matched nicely).

The different CHARSIZE used in the two plots is affecting the position of the plot (by manipulating the plot margins). You could use a POSITION keyword to force the plot into the right place, regardless of the character sizes.

Cheers,

David
