You could look at the functions [http://idlastro.gsfc.nasa.gov/ftp/pro/misc/valid\\_num.pro](http://idlastro.gsfc.nasa.gov/ftp/pro/misc/valid_num.pro)  
and <http://idlastro.gsfc.nasa.gov/ftp/pro/misc/strnumber.pro>

The first uses stregex to identify a valid number, while the second traps a conversion error. They could be used like

if strnumber(x,value) then x = value  
if valid\_num(x,value) then x = value
