Hi folks -

I'm just getting started with using IDL 8.2 (I'm more a 7.* sort of person :))

I'd like to use the CVS versioning tool that's now built in IDL, but I have one problem. When I try to connect in IDL to my local server - which has as cvsroot in all repositories 'cvsroot' - the tool INSISTS on appending 'CVSROOT' to the end of my path. Most frustrating. I cannot seem to find the setting (there is a setting, right?) where I can change this behavior and have it append 'cvsroot' instead. Can anyone help?
