> It is as simple as that! :-)

Does not work for me: when setting !p.multipi=[0, 2, 2, 0, 0] and running it for just one panel, I get the contour plot on the first panel, empty second panel, the grid on the third one, and the map - on the fourth. When I try to go through cgControl (put it = 0 before this three commands, add them as /AddCmd and set it 1 at the end), it accept /AddCmd in cgContour, but crashes ("X connection to localhost:11.0 broken (explicit kill or server shutdown)") when I try to add /AddCmd to cgMap_Grid and cgMap_Continents.

In plus, in grid, among [-180,180] longitudes only the positive ones are labeled, and the latitude lines are missing.

Would I also be damned by some IDL Gods?..
