Hi folks - I had been using IDL 7.1 for quite sometime, but I am now 'upgraded' to IDL 8.2. I am working on a large project with several coworkers, a project which creates a .sav file executable. I want to be able to modify the exiting code and recompile the project. One of my coworkers has a build script he can share with me, but there does not seem to be any way to directly implement it in my copy of IDL - or is there? Can anyone help. Thank you!
