
Subject: !M in IDL8

Did the meaning of !M as an embedded formatting command change in IDL8??

I am running some code that generates plots that worked perfectly in IDL7, but when I run it in IDL8 the entire text after the !M stays in math mode, rather than reverting to the previous font after one character. The online docs seem ambiguous - on http://www.exelisvis.com/docs/Embedded_Formatting_Comm.html it is listed both as "Switch to the math/symbol font for one character, then switch back." under Positioning Commands, and identical to !9 in Changing Fonts within a String.

This is going to be a real pain for any code I have that generates plots in units of solar masses if that's "expected behaviour".

```
IDL> print, !version
```

```
{ x86_64 darwin unix Mac OS X 8.2.1 Aug 20 2012    64    64}
```

-Jeremy.
