Mark's correct. They are completely different Windows controls. You can't change the text on the Save button or on the "Save filter".

The weird thing is that if you click on a different application, and then back on the dialog, it will then display the entire filename.

Luckily, it is usually rare for a GUI application to need to supply an initial filename on an "Open". It's almost always on "Save" that you supply a filename.

That's probably why MS hasn't fixed this bug.
