
Subject: A widget_event() mystery

Hey Folks,

I'm back with another problem. After what I thought would be a routine modification of a compound widget of mine, I ran into a mysterious error originating in XManager. I later eliminated XManager, and made the event call myself with widget_event. The same error occurred. It is:

% Array dimensions must be greater than 0.

Nothing more. Widget_event doesn't even claim it, but the "halted at" is always right on the widget_event call. Since my main widget manager had undergone the most modifications, I swapped it for a dummy event handler, but the error persisted. After three hours of scrutiny, I can find no hint as to the source of the error. The widget is realized without error, and its value is even set, but as soon as an event comes down the pipeline, it crashes.

Perhaps someone has seen this before. Any thoughts?

Thanks,

JD
