Wavelet aided time series forecasting, Artificial Neural Networks, Autoregressive models, Wavelet Neural Network or something else?

Thanks mister Fanning. Normally I would use the first name for people, but I don't dare to use it for you.

I found it quite amazing that at the moment when I decided to start to learn about IDL that I discover some great people out there who know so much more than I do. And the great thing is that they are willing to share their knowledge. In normal life you will never recognize them, but on internet they just come together, from anywhere in the world.

By having said that, I have to correct myself, not everywhere in the world. Cause currently I'm living in Beijing, China, but here it is not possible to access this Google IDL groups nor your website [idlcoyote.com](http://www.idlcoyote.com). Not accessible.

OK, I can access, cause I pay for a VPN, but that doesn't mean that normal people who work here with IDL don't know about you. People copy your website from the world wide web, translate it into Chinese and they put it on the Chinese internet. For me this was new.

About those cross-dimensional wavelet analysis, don't worry, they don't bite. But they can be very nasty.

Thanks for your reply and again thanks for the work what you have done (on behalf of humanity), so people like me can build upon these fundamentals. I will stick to this forum, to vent my feelings of working with IDL in a Chinese research institute and to discover some great ideas from great people.
